Gemstone Labs

Approved knowledge brief for retrieval-augmented generation (RAG)

Purpose

Gemstone Labs builds customer-facing AI chatbots, modern business websites, and voice AI agents. This document consolidates the approved material used by the Gemstone Labs RAG assistant. It is intended as a grounded source: answers should remain within these statements and should offer a human handoff when the evidence is insufficient.

Services

AI chatbots	Customer-facing assistants answer from business-approved knowledge, guide visitors, capture qualified enquiries, and reduce repetitive support work.
Business websites	Modern, responsive websites with clear positioning, persuasive service pages, calls to action, and a short path from interest to enquiry.
Voice AI agents	Voice agents can answer approved questions, qualify enquiries, route requests, and hand uncertain or sensitive matters to a person.
Integrations	Depending on the project, assistants may connect to forms, email, calendars, CRM systems, help desks, product catalogues, and internal knowledge sources.

How the RAG assistant stays grounded

Approved sources only

The assistant searches approved business knowledge before answering. It should not rely solely on general knowledge or invent company details.

Evidence-first retrieval

The existing implementation uses deterministic intent and TF-IDF retrieval, Gemini embeddings, reciprocal rank fusion, and an evidence gate before generation.

Grounded generation

Only selected passages are sent to Gemini. A separate verifier checks the draft. If generation, verification, quota, or network access fails, the system can fall back to the best approved passage.

Human handoff

When confidence is low or a request requires human judgement, the assistant should clearly say so and direct the visitor to a person.

Customer value and project delivery

Business value

A well-designed assistant can shorten response times, answer common questions after hours, guide visitors toward the appropriate service, collect useful lead details, and free teams from repeated answers.

Suitable organisations

Strong-fit organisations receive repeated customer questions, lose enquiries outside working hours, hold valuable knowledge across documents, or need a clearer website. Examples include professional services, education, property, hospitality, ecommerce, clinics with non-medical enquiries, and other customer-focused organisations.

Four-stage process

1. Learn the business, customer questions, and desired outcome. 2. Organise knowledge and design the experience. 3. Build and test realistic questions, edge cases, and handoffs. 4. Launch, review real usage, and improve as the business changes.

Pricing and timing

Pricing is tailored rather than fixed. Scope is based on pages, documents, languages, integrations, and the desired system. Focused projects can often be planned and launched in a few weeks; confirmed timing follows discovery and is included in the proposal.

Languages and support

Multilingual experiences are possible with human review of important translated information. Post-launch support can include unanswered-question review, knowledge updates, testing, service monitoring, website refinement, and approved capability additions.

Safety, privacy, and boundaries

High-risk topics

Gemstone Labs assistants do not diagnose medical conditions or replace qualified medical, legal, or financial judgement. Sensitive, high-impact, or regulated requests should be directed to a qualified person.

Sensitive information

Public assistants should avoid asking for passwords, payment-card details, health information, government identifiers, or other unnecessary sensitive information.

Approved knowledge and disclosure

Projects define their approved knowledge, providers, access, retention, and privacy notices. Personal information is handled only for legitimate service, project, security, or legal needs and is not sold.

Source notes

Compiled from the Gemstone Labs repository: README.md, chatbot/README.md, and chatbot/knowledge_base.json. Contact: hello@gemstonelabs.ai. This brief is a test corpus and must be refreshed when the approved website or knowledge base changes.
